

Ascent Studios

Website — Architecture, Integrations & Repository State

Project summary · Generated 18 June 2026 · github.com/tjamiy11/Ascent-creative

1. What this is

Ascent Studios is the marketing website for a Chicago-based video & photography studio (founder: Stefan, IG [@uglysteffy](#)). It is an editorial, motion-forward portfolio site: a kinetic hero, a portfolio/work grid of 53 projects, per-project case-study pages, an about page, a testimonials page, and a contact page.

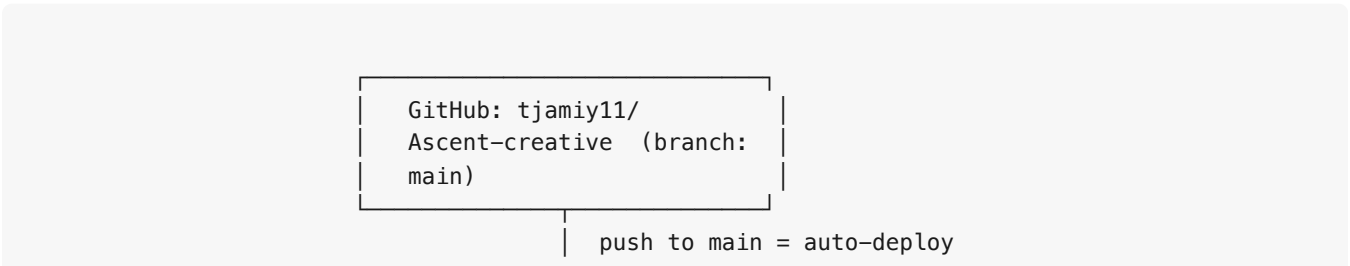

Aspect	Detail
Live URL	<code>ascentstudios.co</code>
Repository	<code>github.com/tjamiy11/Ascent-creative.git</code> (private remote, branch <code>main</code>)
Package name	<code>ascent-creative-co</code> v0.1.0
Tracked files	123 files in git

2. Tech stack

Layer	Technology	Role
Framework	Next.js 16.2.4 (App Router)	Routing, SSR/SSG, image optimization
Language	TypeScript 5	All app/lib/component code
UI runtime	React 19.2	Components
Styling	Tailwind CSS v4 (+ PostCSS)	Design system / utility styling
Motion	Framer Motion 12 + Lenis 1.3	Reveals, page transitions, smooth scroll
Content	MDX (@next/mdx, gray-matter)	Optional per-project case studies
Utilities	clsx	Class composition
Linting	ESLint 9 + eslint-config-next	Code quality

No database, no auth, no backend API. The site is fully static/edge-rendered with no required environment variables.

3. The integration map

▼

```
VERCEL (project: "ascent-studios")
org/team: team_7St938CMh4tMv9PveSYmDIUC
projectId: prj_KLNWv0heULx6W5mPTofExDrMcAh9
→ builds Next.js, serves ascentstudios.co
→ optimizes /public images (covers, logos, photos)
→ .vercelignore keeps multi-GB raw media OUT of deploy
```

↓ <video> tags + hero point to hardcoded URLs

```
CLOUDFLARE R2 (public bucket)
pub-1782b44702d746a7a6cc86a019b0fb9f.r2.dev
→ hosts every .mp4 (hero.mp4 + 24 project clips)
→ mp4s are git-ignored; only .jpg covers live in repo
```

Google Forms (optional) → contact page inquiry form
(not yet wired – currently mailto fallback)

4. Cloudflare R2 — the video CDN

Cloudflare R2 is the **only third-party service the running site depends on**. All video playback is served from a single public R2 bucket; no Cloudflare Workers, Pages, or Images product is used — just R2 object storage exposed over its public `r2.dev` URL.

Item	Value
Public bucket URL	<code>https://pub-1782b44702d746a7a6cc86a019b0fb9f.r2.dev/</code>
Hosts	1 hero reel (<code>hero.mp4</code>) + 24 project clips (hoka, dtlr, palmer, samsung, ducati, lollareverb, croatia, missusa, blum, trulli, candycloud, morph, halogram, giftcard, teaser, boxed, multiple, sonim, jordan-pele, dreamy, nick-blum, uglysteffy, vespa, adidas-macys)
Referenced in	<code>lib/projects.ts</code> (24 <code>clip:</code> URLs) & <code>components/hero-reel.tsx</code> (hero source)
Why R2	mp4s are multi-MB each; keeping them out of git/Vercel avoids repo bloat and deploy-size limits. R2 has zero egress fees.

How a video gets added: transcode `.mov` → small `.mp4` (`ffmpeg -i in.mov -c:v libx264 -crf 24 -vf "scale=1280:-2" out.mp4`), upload the mp4 to the R2 bucket, set `clip:` to the R2 URL in `lib/projects.ts`, and drop a first-frame `.jpg` cover into `public/video/`. The repo never stores the mp4.

5. Vercel — hosting & deploy

- **Project:** `ascent-studios` (linked via local `.vercel/project.json`).
- **Deploy trigger:** every push to `main` on GitHub auto-deploys to production at `ascentstudios.co`.
- **Environment variables:** none required — video URLs are hardcoded.

- **Build:** `next build` (default). Image optimization runs on `/public` covers, logos, and photos.
- **Deploy hygiene:** `.vercelignore` excludes the local raw-media working folders (`/Videos/` , `/Photos/` , `/Thumbnails/` , `/company logos/`) and all `public/video/*.mp4` so multi-GB sources never upload. A case-insensitivity quirk that previously broke deploys is documented in the file.

6. Repository structure

app/	Routes (App Router)
├ page.tsx	Home – 5 numbered sections, kinetic hero, photo strips
├ work/page.tsx	Portfolio grid (53 projects)
├ work/[slug]/	Per-project case-study page (dynamic)
├ about/page.tsx	About + founder portrait
├ contact/page.tsx	Inquiry form (Google Forms or mailto fallback)
├ testimonials/	Client quotes page
├ layout.tsx	Root layout, template.tsx page transitions
├ globals.css	Tailwind v4 + design tokens
└ icon/og/twitter	Favicon + social share images
components/	16 components – nav, footer, hero-reel, hero-background, video-carousel, work-card/grid, photo-masonry/strip, marquee, testimonial-carousel, inquiry-form, reveal, smooth-scroll, contact-cta, mdx-blocks
lib/	
├ projects.ts	53 projects: titles, covers, R2 clips, tags, galleries
├ site-config.ts	Studio name, email, socials, 23-client marquee, form
└ testimonials.ts	Client testimonial copy
content/projects/	Optional MDX case studies (index.ts registry)
public/	
├ video/	.jpg covers (mp4s on R2) + a few local .mp4s
├ photos/	Transcoded portfolio photos (~13 MB)
├ logos/	23 client logos (PNG/SVG)
├ brand/	Ascent wordmark variants (h/v × grey/white)
└ placeholders/	Fallback covers/clips (Git LFS tracked)
scripts/check-mdx-slugs.mjs	Validates MDX slugs match projects

Site content captured in config

- **Contact:** stefan@ascentstudios.co
- **Socials:** IG @uglysteffy (personal), @ascentstudios.co (studio)
- **Clients marquee (23):** Nike, Hoka, Adidas, Arc'teryx, Amazon, Lexar, Ducati, PGYTECH, Insomniac, Wynn Las Vegas, XS Las Vegas, Skybar, Palmer House, Club Quarters, Mamitas, Bounce, Jon Cotay, Flygta Airlines, DTRL, DTA, Samsung, Country Splash
- **Inquiry form:** Google Forms slot exists (inquiryForm.googleFormsUrl) but is currently *empty* → contact page shows the styled mailto fallback until a form URL is pasted in.

7. What has NOT been pushed to the repo

main is **fully in sync with origin/main** (0 commits ahead). The unpushed material falls into three buckets:

A. Uncommitted working-tree changes (modified, tracked files)

File	Change
lib/projects.ts	+159 / -0 lines — largest change (new projects / metadata)

<code>components/footer.tsx</code>	~20 lines changed
<code>components/nav.tsx</code>	~12 lines changed
<code>app/favicon.ico</code>	replaced (25.9 KB → 5.4 KB)
<code>public/video/missusa.jpg</code>	cover image replaced

B. Untracked files (new, never added to git)

Path	Size	Note
<code>app/icon.png</code>	16 KB	App icon — likely should be committed
<code>app/apple-icon.png</code>	4 KB	Apple touch icon — likely should be committed
<code>app/opengraph-image.png</code>	8 KB	OG social share image — likely should be committed
<code>app/twitter-image.png</code>	8 KB	Twitter share image — likely should be committed
<code>public/brand/</code>	152 KB	Ascent wordmark variants — likely should be committed
<code>public/video/*.jpg</code> (6)	~640 KB	New covers: adidas-macys, dreamy, jordan-pele, nick-blum, uglysteffy, vespa — needed by Next.js Image
<code>LOGOS_PNG/</code>	1.9 MB	Working folder — probably local-only source assets
<code>.claude-flow/</code>	4 KB	Tooling state — local-only, do not commit

Also present but intentionally git-ignored (local-only working media, never meant for the repo): `Videos/`, `Photos/`, `Thumbnails/`, `Company logos/`, `company logos/`, the `.next/` build, and all `public/video/*.mp4` clips (those belong on R2).

C. An entire local branch that was never pushed ⚠

The remote (`origin`) only has one branch: `main`. The local branch `home/testimonial-carousel` is **18 commits** that do not exist on the remote — it has no upstream and was never pushed. It contains the full early build history of the site, e.g.:

- Initial scaffold: Next.js 16 + Tailwind v4 + TS
- Build out the studio site: Home, Work, About, Contact
- Cinematic redesign: dark palette, typographic hero, ContactCTA
- Hero experiments: WebGL glass icosahedron (R3F), then reverted to typographic-only
- Landing: restructure home around 5 numbered sections
- Add `/testimonials` page + revolving company banner; horizontal testimonial carousel
- Videos: replace placeholder content with real client work

Worth confirming: whether `home/testimonial-carousel` is dead history (already superseded by what's on `main`) or contains work that still needs to be merged. The three `claude/*` worktree branches are all even with `origin/main` (0 ahead) — nothing pending there.

8. Quick-reference summary

Question	Answer
What hosts the site?	Vercel (project <code>ascent-studios</code>), auto-deploy on push to <code>main</code>
What hosts the videos?	Cloudflare R2 public bucket — 25 mp4s, hardcoded URLs
Any secrets/env vars?	None required
Is <code>main</code> pushed?	Yes — in sync with origin
What's unpushed?	5 modified files + ~2.5 MB untracked assets (icons, brand, covers) + an 18-commit local branch
Biggest gap to close	Commit the new social/app icons, brand assets, and 6 video covers; decide the fate of <code>home/testimonial-carousel</code>
